U.S. OBSERVATIONS OF THE JAPANESE MOTHERSHIP
SALMON FISHERY DURING 1983

by

Michael L. Dahlberg

Northwest and Alaska Fisheries Center Auke Bay Laboratory
National Marine Fisheries Service, NOAA
P.O. Box 155, Auke Bay, AK 99821

Submitted to the

INTERNATIONAL NORTH PACIFIC FISHERIES COMMISSION

by the

U.S. NATIONAL SECTION

February 1983

This paper may be cited in the following manner: Dahlberg, M. L. 1983. U.S. observations of the Japanese mothership salmon fishery during 1983. (Document submitted to meeting of the Ad Hoc Working Group on Salmon, International North Pacific Fisheries Commission, Nanaimo, British Columbia, Canada, March 1983. Northwest and Alaska Fisheries Center, Natl. Mar. Fish. Serv., Natl. Oceanic Atmos. Admin., Auke Bay Laboratory, P.O. Box 155, Auke Bay, AK 99821.)

Preliminary discussions on the 1983 U.S. salmon observer program took place at an informal meeting with Japanese mothership fleet commanders in Tokyo at the time of the 1982 Annual Meeting. Those discussions were not conclusive. At the Nanaimo meeting of the Ad Hoc Salmon Research Research Coordinating Group in March 1983, the United States submitted a proposal for U.S. observations of the Japanese mothership salmon fishery during 1983 (Docu2623). Under this plan, deployment and duties of U.S. salmon observers aboard the Japanese motherships fishing in the U.S. FCZ in 1983 will be similar to that in previous years.

In Document 2623, the United States also outlined a plan to establish a system of regular placement of observers aboard each fleet's catcher boats. The program reflected principally the concern of the United States and Canada over the reported catch of chinook salmon, most of which are of western Alaska and Canadian Yukon River origin, and the desire to have catcher-boat observations of salmon made by trained salmon observers. Japan noted the concern over this problem which it was working towards eliminating. Considerable discussion took place on the level of catcher-boat observations planned. Japan noted the logistical problems the program raised and the great difficulty of accommodating salmon observers in addition to the marine mammal observers, particularly since it is Japan's understanding that duties of the marine mammal observers aboard catcher boats include observations on chinook salmon. Therefore, the United States proposed alternatively that in 1983 there be observations of five, preferably separate, gillnet operations by a U.S. salmon observer aboard catcher boats for each mothership fleet fishing in the U.S. FCZ in July, with additional observations of operations by U.S. salmon observers to be arranged for the month of June if possible. Japan agreed on the understanding that this was a target figure and that the placement of observers would be in full consultation with the fleet commanders recognizing their responsibility for safety of the observers. Japan stated that it would cooperate as much as possible in the observer program and that U.S. salmon observers could, after consultation with catcher-boat fishing masters, have access to the fishing decks for species identification of salmon and biological sampling of steelhead trout after nets have been retrieved. Japan stated that it would expect fleet commanders and observers to report in writing at the end of the season on any reasons for nonfulfillment of observer program objectives. Pages 2 and 3 contain the original sampling plan as proposed by the United States in Document 2623; pages 3 and 4 contain the revised plan which was adopted by the three national sections at the Nanaimo meeting.

U.S. SALMON OBSERVER PROGRAM IN 1983

As part of the Annex [Paragraph 1(c)] to the amended International Convention for the High Seas Fisheries of the North Pacific Ocean (INPFC), the Government of Japan may be required by the Government of the United States to accept scientific observers on board vessels fishing within the United States Fishery Conservation Zone (U.S. FCZ). The United States plans to place observer teams similar to those used since 1978 on board each of the Japanese salmon motherships and occasionally on catcher boats operating within the U.S. FCZ in 1983. One observer will monitor salmon operations in each fleet.

Mothership Observations in 1983

Salmon observers will be placed aboard the motherships to collect data on total catch, fishing effort, and average weight of each species. The salmon observers' duties are:

- 1) Observe and record daily catch weights of salmon, by species, as the fish are transferred from each of the catcher boats to the mothership. Each day, the observer must obtain the following information in writing or tables from the fleet commander or Japan Fisheries Agency (JFA) inspector:
 - a) the average weight of 30 fish of each salmon species, if available, from each of 5 catcher boats and the identification number of each of the 5 catcher boats;
 - b) the catch weights of salmon, by species, for catcher boats not actually observed; the total effort and effective effort in tans of gillnet for each catcher boat in the fleet; and the geographical coordinates where each catcher boat sets its nets; and
 - c) the latitude and longitude of the mothership at noon Japan Standard Time and air and surface-water temperatures.
- 2) Record daily the catch weight of salmon, by species, from each of the scout boats in the mothership fleet. (Data obtained from the ship's log or from the JFA inspector.) Also record the total fishing effort and effective fishing effort in tans of gillnet and latitude and longitude of each set for each of the scout boats.
- 3) Summarize daily catcher-boat landings, by salmon species; summarize catch-effort data, by $1^{\circ} \times 1^{\circ}$ INPFC statistical area; and prepare a radio message for transmission to the National Marine Fisheries Service Alaska Regional Office, Juneau, Alaska.
- 4) Randomly select one weighing container of each species each day and count the salmon within it to determine average weight of fish in the container and compare this figure with the average obtained by weighing groups of 30 fish.
- 5) Collect biological data including scales from chinook salmon.

Catcher boat Observations in 1983

In each fleet, salmon observers will be placed aboard catcher boats selected by mutual agreement between the salmon observer and fleet commander every third day of the fishing season. The observer will spend one day aboard the catcher boat followed by two days aboard the mothership and continue this sampling schedule until the end of the fishing season within the U.S. FCZ. The observers' duties are:

- 1) Observe and record the time of day of setting the nets, record the number of salmonids dropping out of the net and lost to the sea during net retrieval, and estimate the number of salmonids landed by species each day while on board.
- 2) Record the total fishing effort and effective fishing effort in tans of gillnet and latitude and longitude to the nearest degree and whole minute where the nets were initially set.
- 3) Collect biological data including body weight and length from each species and scales from chinook salmon and sockeye salmon. All steelhead trout will be collected by the observer and frozen whole for transfer back to the United States with frozen specimens of marine mammals.
- 4) Observe and record the incidence of salmonids missing the adipose fin and sample snouts from all salmonids missing the adipose fin.
- 5) Photograph the operation of the catcher-boat crew and gear during setting and retrieving the nets and document the procedures for handling fish brought aboard by taking photographs of deck operations until the catch is transferred to the mothership.

When the observer returns to the mothership after the catcher-boat landings are transferred, he will resume his duties on board the mothership as described above.

When the motherships and catcher boats are fishing seaward of the U.S. FCZ, the salmon observers will consider themselves guests of the mothership and conduct themselves in accordance with procedures agreed upon by the United States and Japanese governments.

U.S. SALMON OBSERVER PROGRAM IN 1983
(Revised)

As part of the Annex [Paragraph 1(c)] to the amended International Convention for the High Seas Fisheries of the North Pacific Ocean (INPFC), the Government of Japan may be required by the Government of the United States to accept scientific observers on board vessels fishing within the United States Fishery Conservation Zone (U.S. FCZ). The United States plans to place observer teams similar to those used since 1978 on board each of the Japanese salmon motherships and occasionally on catcher boats operating within the U.S. FCZ in 1983. One observer will monitor salmon operations in each fleet.

Mothership Observations in 1983

Salmon observers will be placed aboard the motherships to collect data on total catch, fishing effort, and average weight of each species. The salmon observers' duties are:

- 1) Observe and record daily catch weights of salmon, by species, as the fish are transferred from each of the catcher boats to the mothership. For each day's catch, the observer must obtain the following information in writing or tables from the fleet commander or Japan Fisheries Agency (JFA) inspector:
 - a) the average weight of 30 fish of each salmon species, if available, from each of 5 catcher boats and the identification number of each of the 5 catcher boats;
 - b) the catch weights of salmon, by species, for catcher boats not actually observed; the total effort and effective effort in tans of gillnet for each catcher boat in the fleet; and the geographical coordinates where each catcher boat sets its nets; and
 - c) the latitude and longitude of the mothership at noon Japan Standard Time and air and surface-water temperatures.
- 2) Record the daily catch weight of salmon, by species, from each of the scout boats in the mothership fleet. (Data obtained from the ship's log or from the JFA inspector.) Also record the total fishing effort and effective fishing effort in tans of gillnet and latitude and longitude of each set for each of the scout boats.
- 3) Summarize daily catcher-boat landings, by salmon species; summarize catch-effort data, by 1° x 1° INPFC statistical area; and prepare a radio message for transmission to the National Marine Fisheries Service Alaska Regional Office, Juneau, Alaska.
- 4) Randomly select one weighing container of each species each day, when aboard, and count the salmon within it to determine average weight of fish in the container and compare this figure with the average obtained by weighing groups of 30 fish.
- 5) Collect biological data including scales from chinook salmon and steelhead trout.
- 6) Observe and record the incidence of salmonids missing the adipose fin and sample the snouts from all salmonids missing the adipose fin.

When the motherships and catcher boats are fishing seaward of the U.S. FCZ, the salmon observers will consider themselves guests of the mothership and conduct themselves in accordance with procedures agreed upon by the United States and Japanese governments.

Catcher boat Observations in 1983

In each fleet, the salmon observer will be placed aboard catcher boats according to the following plans adopted at the March 1983 meeting of the Ad Hoc Salmon Research Coordinating Group:

- 1) The goal is for each observer to board catcher boats and observe operations during five, preferably separate, days in July. The observers will attempt to arrange for additional catcher boat observations in June.
- 2) The timing of trips on catcher boats and the selection of catcher boats to be visited will be determined by the fleet commander, in communication with the observers.

The observers' duties are:

- 1) Observe and record the time of day of setting the nets, record the number of salmonids dropping out of the net and lost to the sea during net retrieval, and estimate the number of salmonids landed aboard the catcher boat by species each day while on board. When conditions are considered safe by the fishing master (Sendo), the observer will have access to the landed catch on deck in order to determine species composition and estimate the numbers of fish by species and to take scale samples and biological data from any steelhead trout.
- 2) Record the total fishing effort and effective fishing effort in tans of gillnet and latitude and longitude to the nearest degree and whole minute where the nets of the catcher boat were initially set.
- 3) Collect biological data including body weight and length from steelhead trout which will be frozen whole for transfer back to the United States with frozen specimens of marine mammals.
- 4) Photograph the operation of the catcher-boat crew and gear during setting and retrieving the nets and document the procedures for handling fish brought aboard by taking photographs of deck operations until the catch is transferred to the mothership.

When the observer returns to the mothership after the catcher-boat landings are transferred, he will resume his duties on board the mothership as described above.
