Abstract

In Alaska, mass-marking of salmon using otolith thermal marking is an effective research and management tool applicable to a variety of situations. For brood year 2006, approximately 53 million sockeye, 7 million chinook, 505 million chum, 9 million coho, and 730 million pink salmon will be marked at 23 different hatcheries using 78 thermal marks.

Introduction

In Alaska, thermal marking is used to provide information about the contribution of hatchery fish, primarily pink, chum and sockeye salmon, to commercial and cost-recovery fisheries during the summer fishing season. Because most fisheries are managed on the basis of wild stocks, fishery managers subtract the estimated hatchery catch from total catch and use that information to structure the fisheries. Hatchery operators are most interested in their own production and use thermal marking to estimate how their fish contribute to traditional fisheries and to terminal harvests. In addition, thermal marks are being used to determine the origin of juvenile and immature salmon collected during surveys in the Gulf of Alaska by the National Marine Fisheries Service and as part of the Bering Sea and Aleutian Island Salmon Investigative Study (BASIS) program.

Plan for 2006 brood year stocks

The proposed thermal marks for brood year 2006 salmon are listed in Table 1. We plan to mark approximately 53 million sockeye, 7 million chinook, 505 million chum, 9 million coho, and 730 million pink salmon will be marked at 23 different hatcheries using 78 thermal marks. The proposed otolith plan shows how some marks are scheduled to change in future years. Some marks are on an every other year cycle, while others rotate on a three-year cycle. Thermal mark patterns are presented in both the RBr notation (Munk and Geiger 1998), with the modification by Hagen (1999) to include narrow ring bands; as well as in the Hatch Code notation (Hagen et al, 2000).
